FAQ

What is Farhat Guitar Chord Fonts?

It is a font that can be used in Windows and Linux so that you input guitar chord windows into a word processor next to your lyrics.

Are there other different types of fonts that can generate chords like these?

Yes sure, but unlike other fonts, with Farhat Guitar Chord Fonts the user can also easily generate non-standard chords thus giving much greater flexibility.

How much does it cost to use them?

Farhat Guitar Chord Fonts is freeware and can be installed on any number of computers and copied many times without restriction. It was always my wish that it is (and never will be) used for commercial purposes or financial gain.

Who has the rights to Farhat Guitar Chord Fonts?

Me, Marcos Augusto Farhat ;-)

I am a guitar teacher and would like to use this font for songs and then give the printouts to my students. Do I have to ask permission or pay any money?

No, but as a matter of courtesy and politeness it would be nice if you let me know beforehand that they being used. I would be very grateful to you for informing me.

Email: contact@farhatguitar.com

I have a free website and want to include this font for download.

If you are not making any money yourself from this, then no problem.

Can I sell them?

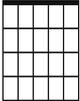

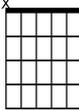

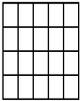

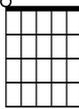

No, I own all the rights, so you cannot sell them except with my express and written consent.

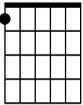

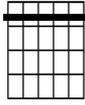

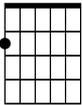

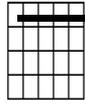

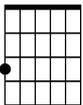

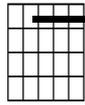

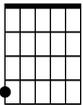

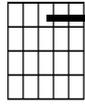

Installation

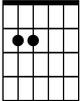

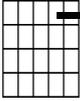

- 1- Download the fonts from www.farhatguitar.com > Tools > Fonts
(Other download websites and mirrors are also available.)
 - 2- Follow the rest of the instructions on that page to install them.
 - 3- Start Word and 'Open' a 'New Document', then click on the arrow which is to the right of the current font name to reveal its drop-down menu. Scroll down until you get to Farhat (**not** the one called Farhat Font). (It usually has just one chord window instead of its name in normal letters – don't choose any of the other fonts which have many chord windows in their names.)
 - 4- Select that font by clicking on it.
- Tip: choose a large font size (e.g. 40) to start with – you can always change it later.
- 5- Now you can start creating your chords!!!!

Function of each letter when using the font

These instructions are based on a standard UK/US keyboard and UK/US regionalisation chosen in Control Panel settings. Other keyboards for other countries & languages may have letters and characters in different positions – beware!!

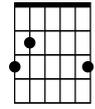

<p>a</p>	<p>To generate an empty chord window WITH A NUT (i.e. fret zero)</p> <p>Type in "a"</p> 	<p>d</p>	<p>To generate an 'X' at the end of the fretboard of a chord window to show that a certain string should NOT be sounded as part of that chord</p> <p>Example: Type in "a" and then "d" (Use Backspace to delete last entry and left-right cursor keys to navigate if necessary.)</p> 
<p>Z</p>	<p>To generate an empty chord window WITHOUT A NUT (i.e. the chord is somewhere in the middle of the fretboard – a user-defined position)</p> <p>Type in "z"</p> 	<p>f</p>	<p>To generate an 'o' symbol at the end of the fretboard in a chord window to show that the string is open and MUST be sounded as part of that chord.</p> <p>Example: Type in "a" and then "f"</p> <p>This can be combined with typing in "d" to show Xs as well.</p> 

<p>X</p>	<p>To generate a black spot (finger dot) on the first fret of the fretboard to show that a finger on the left hand must be pressed onto that string on that particular fret.</p> <p>Type in "a" and then "x"</p> 	<p>W</p>	<p>Generates a full 6-string barre using the first finger of the left hand.</p> <p>Example: Type in "z" and then "w"</p> 
<p>c</p>	<p>Generates a finger dot on the second fret of the fingerboard</p> <p>Example: Type in "a" and then "c"</p> 	<p>e</p>	<p>Generates a 5-string barre</p> <p>Example: Type in "z" and then "e"</p> 
<p>v</p>	<p>Generates a finger dot on the third fret of the fingerboard</p> <p>Example: Type in "a" and then "v"</p> 	<p>r</p>	<p>Generates a 4-string barre</p> <p>Example: Type in "z" and then "r"</p> 
<p>b</p>	<p>Generates a finger dot on the fourth fret of the fingerboard</p> <p>Example: Type in "a" and then "b"</p> 	<p>t</p>	<p>Generates a 3-string barre</p> <p>Example: Type in a "z" and then "t"</p> 

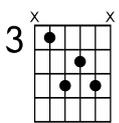

<p>S</p>	<p>To skip a string without entering anything (jumps to the next string). Spacebar also has the same effect.</p> <p>Example: Type in "a" (chord window at fret zero) and then "s" (skip a string) and then two times "c" (dots on second fret of 5th & 4th strings) then 3 times "s" to quickly and easily create E minor.</p> 	<p>y</p>	<p>Generates a 2-string barre</p> <p>Example: Type in "z" and then "y"</p> 

Number keys

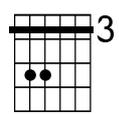

Number keys 1 through 9 generate a number adjacent to the chord window (or on the string if you prefer) to show fret positions higher up the fretboard. The equals sign **"="** produces the number 10. For fret numbers over 10 use two number keys consecutively.

Basic Examples**Example #1: G major (open chord)**

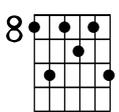

1.
Type in **"a"** - this produces a chord window with nut (fret zero)
2.
"v"
It generates a dot at the 3rd fret (6th string)
3.
"c"
It generates a dot at the 2nd fret (5th string)
4.
"s"
Skips to the next string (no dot entered)
5.
"s"
Again skips this string
6.
"s"
Skips once more
7.
"v"
It generates a dot at the 3rd fret (1st string)

Example #2: Cmaj7 (3rd fret)

1.
Type in **"3"**
2.
"z"
3.
"d"
4.
"x"
5.
"v"
6.
"c"
7.
"v"
8.
Finally **"d"**

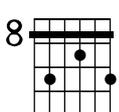

Building more advanced chords**Example #1: G minor (barre chord)**

1. Type in **"z"** (generates a chord window without nut)
2. Type in **"w"** (generates a 6-string barre)
3. Then **"s"** (skips a string, leaves string 6 empty)
4. Now two times **"v"** (generates a dot on the 5th & 4th strings on the 3rd fret)
5. Three times **"s"** (leave strings 3, 2 and 1 empty)
6. Finally, type in the number key **3** (three) to show that the barre is at the 3rd fret. (If you prefer your number on the left hand side of the chord window, simply do this step first before pressing **"z"**.)

Example #2: C9 (8th fret position)

1. Type **"8"**
2. Type **"z"**
3. Type **"x"**
4. Type **"v"**
5. Type **"x"**
6. Type **"c"**
7. Type **"x"**
8. Type **"v"**

Of course, the 3 finger dots on the 8th fret effectively mean you have to barre that fret with your first finger. If you want to show it that way, simply replace the first 3 steps with **"8"** **"v"** **"w"** and complete the other finger dots using **"s"** to skip strings as necessary, like so:

Overview of all the functions on the keyboard

Familiarise yourself with the use of each key. (To test these examples you must have the font 'Farhat' installed in Windows and also selected in the drop-down font menu in Word. A large font size makes your chords easier to see. Make sure Bold, Italics & Underline are all switched off – otherwise strange things might happen!!)

(d) Generates an 'X' above each string to show that that this string is NOT played as part of the chord

(f) Generates an empty circle above each string to show that this string MUST be played as part of the chord

(a) Generates an empty chord window with nut (fret zero)

(b) Generates a finger dot at the **fourth** fret of currently selected string

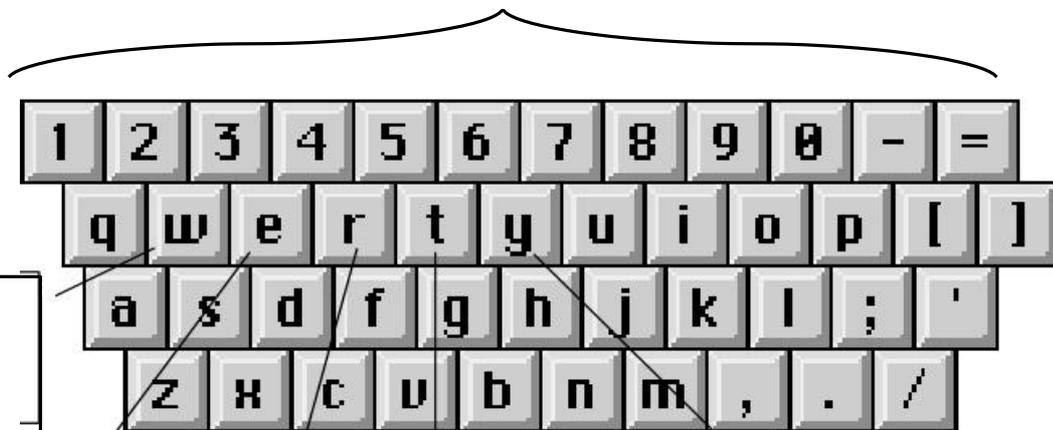

(z) Generates an empty chord window without nut (user-defined fret position)

(v) Generates a finger dot at the **third** fret of currently selected string

(x) Generates a finger dot at the **first** fret of currently selected string

(c) Generates a finger dot at the **second** fret of currently selected string

Number keys 1 to 9 and the equals sign "="
Used to indicate the fret number when using an empty chord window without nut ("**z**")

(w) Generates a six-string barre symbol

(e) Generates a five-string barre symbol

(r) Generates a four-string barre symbol

(t) Generates a three-string barre symbol

(y) Generates a two-string barre symbol
